CAREER OBJECTIVE

Seeking challenging job opportunities in the Manufacturing industry, in a position that allows me enact my wealth of experience in Lean Systems, Manufacturing, Hybrid powertrains, 3D printing and IoT into organization's processes and acquire more knowledge to tackle challenges involving innovation and technology.

PROFESSIONAL SUMMARY

Hardworking and Innovative Engineer with strong academic and hands-on experience in the field of Manufacturing possessing vast expertise in executing innovative projects successfully from inception to completion within set durations and budgets. Easily adapts to changing work environments irrespective of geographical locations within a short time and work collaboratively with/in a team of cross-functional professionals. Adept at multitasking and providing the needed leadership for teams, motivating and making right decisions under intense conditions as appropriate. Areas of Expertise include:

- Lean Design and Development
- Production Technology
- Lean Systems and application
- Hybrid powertrains
- Industrial Ergonomics
- Continuous Improvement in operations
- Product Design
- Project Management
- 3D printing

EDUCATION

Master of Science in Engineering Management

Northeastern University, Boston, MA, US

December 2017

Relevant Coursework: Lean Design and Development, Operations Research, Economic Decision Making

Bachelor of Engineering in Industrial Engineering

BMS College of Engineering, India

2011- 2015

PROFESSIONAL EXPERIENCE

MANUFACTURING LEAD ENGINEER

Pearlite Liners Private limited, India

Feb. 2015- Aug. 2015

- Worked collaboratively with the Management team in the implementation process of Kaban and BPR in the production line and machining units.
- Developed new and improved structures for centrifugal castings to eliminate shrinkage and blow holes
- Implored appropriate Lean Six Sigma techniques in production processes, significantly conserving end- to-end production time by 9%
- Expedited sand molding processes by interpreting and remodeling risers and gates for Die-casted components
- Redesigned Fin clamps for wet cooled cylinder liners to avoid fin breakage and defects
- Reviewed, maintained and created operational standards and kept updated information in appropriate systems
- Investigated and analyzed production methods, processes and operations in order to determine manufacturing modifications that will increase production efficiency and reduce costs.
- Participated in product designs using appropriate manufacturing techniques to ensure the components can be manufactured cost effectively.
- Compiled and analyzed significant data relative to solving manufacturing problems and reducing production time

INTERN LEAN FACILITATOR

Weir minerals, India

May 2014- Aug. 2014

- Implemented appropriate value engineering techniques in the reduction of lead time in the manufacturing process of slurry pumps. Successfully reduced it by 8mins.
- Utilized Arduino sensors with NFC and BT 4.0 for the amplification of new frameworks for recording assembly data
- Monitored working mechanisms of Powertrain by designing reviews for control systems & value stream mapping
- Optimized cost on Material management, and transportation by the periodic and continuous review of policies on procurement and demand

TRAINEE INDUSTRIAL ENGINEER

Model lathe works, India

May 2013- August 2013

- Embedded IoT sensors to record product count and successfully integrated it to cloud server for live analysis
- Enhanced production path by implementing critical path method to save lead time by 3mins
- Redesigned the fixtures to drill on fins of wet cylinders to save effort and time
- Expedited Plateau honing process by optimizing component flow from manufacturing plant to machining unit

TECHNICAL PROJECTS

3D Printed emergency housing

2017

- Developed 3D printing nozzle for concrete and resin, then fitted on a robotic arm for house construction.
- The robotic arm was fitted a custom placer for dry walls and resin glue to aid in house construction.
- Prototype developed and validated at Autodesk Buildspace, Boston, MA

IoT Water monitoring system

2017

- Designed a smart IoT enabled water monitoring system for households with cloud integration and live view.
- Prototyped device could detect water leaks and over usage of water for multiple water outlets.

Solar Electric Mechanical hybrid car

2016

- Headed the team and developed working prototype of hybrid SEM (Solar Electrical Mechanical) car
- Developed car could switch between different power systems on the run, controlled by a central ECU
- Awarded Young scientist award for prototype from H.E President of India at the time

Lean manufacturing of centrifugal cylinder liners

2015

- Performed detailed lean analysis for manufacturing and cylinder liners (Wet /Air cooled) for heavy diesel engines
- Applied lean concepts, value engineering to reduce end to end lead time by 12% per component
- Remodeled material flow paths and production routes by operations research for efficiency

Power shared eco-friendly car

2014

- Developed a multi-effort 4-wheeler for short transportation powered by pedals and multiple differentials
- Designed vehicle could transported five people with minimal effort, no pollution
- Won 2 national awards and 1 state award for innovation and Zero pollution design

ADDITIONAL SKILLS

Strategy Development | Communication | Multitasking | Organization | Team Development | Policy Adherence | Team Work | Configuration Management | Client Relations | Reporting | Problem Solving | Coordination | Time Management.
