SKILLS

APPLICATION DEVELOPMENT

Plan/Collaboration:

• Jira • Confluence • Slack
Application/Sql/Markup Languages:

• Python • Java • Golang • HTTP
• MySQL • MariaDb • Postgres
• Bash • PowerShell • Yaml • Json

IDE and Linux Text Editors:

• Emacs • Nano • Vi/Vim

Source Code Management:

• Git • Github • Gitlab • BitBucket

IT OPERATION

Web Servers/Load Balancers:

• Nginx • HAProxy • Apache2 • Tomcat

CI/CD Pipeline Orchestration:

• Jenkins • Gitlab CI

Build Automation/Task Runners:

• Gradle • Grunt • PyBuilder • Pipenv

Test Automation:

• Selenium • SonarQube • Trivy

Containerization and Orchestration:

• Docker • Kubernetes • Helm • Packer

• Istio Service Mesh • ArgoCD

Infrastructure As Code(Iac):

• Terraform • Ansible • Chef • Puppet

Monitoring and Logging:

• Prometheus • Grafana

• Elasticsearch • FluentBit • Kibana

COURSEWORK

UNDERGRADUATE

System

• Computer Architecture

• Operating Systems

Theory and Programming

• Introduction to Computing

• Intermediate Data Structures

• Programming in C

• Advanced Algorithms

• Applied Discrete Mathematics

• Theory of Computation

• Structure of Higher Level Languages

• Database Management System

• Neural Networks

CERTIFICATION

CLOUD COMPUTING

Amazon Foundational Certificate

• AWS Certified Cloud Practitioner

EDUCATION

UNIVERSITY OF MASSACHUSETTS

Bachelor in Computer Science

Latin Honor: Cum Laude

May 2023 | Boston, MA

WORK EXPERIENCE

KLOUDTOM CONSULTING SERVICES | AWS Devops Internship

December 2024 – August 2025 | Remote

- Developed, maintained, and deployed applications, ensuring optimized performance and smooth integration with backend services.
- Provisioned and managed AWS services such as EC2, S3, and RDS using Terraform, ensuring high availability and scalability for production environments.
- Configured and deployed AWS SFTP servers via Terraform, managing user access and roles through IAM and securing credentials using AWS Secrets Manager.
- Developed scripts using Python, Bash, or PowerShell for automating repetitive tasks and improving operational efficiency.
- Designed and implemented Jenkins/Gitlab CI pipelines for continuous integration and delivery, automating build, test, and deployment processes for faster and more reliable releases.
- Created and maintained reusable Terraform modules to standardize infrastructure deployment across multiple environments (development, staging, production).
- Managed multiple Jenkins jobs, optimizing job execution by integrating shell scripts, SCM polling, and Slack notifications for timely updates.
- Worked closely with cross-functional teams using Jira for task tracking and Confluence for documenting processes and project updates, ensuring seamless collaboration across the project lifecycle.
- Monitored and fine-tuned Jenkins/Gitlab CI pipelines to improve build speed and deployment efficiency.
- Designed monitoring and logging systems using AWS CloudWatch, AWS X-Ray, or third-party tools like Datadog, Prometheus, or ELK Stack.

PROFESSIONAL DEVELOPMENT

KODEKLOUD | DevOps Engineering Training

March 2024-December 2024 | Remote

- Mastered how to automate the software delivery lifecycle, including building, testing, and deploying applications. This involves hands-on labs experience with popular tools like Jenkins, GitLab CI/CD, and ArgoCD.
- Mastered how to package applications and their dependencies into portable containers using Docker as well as managing and scaling these containers efficiently across clusters with Kubernetes.
- Gained hands-on experience on managing and provisioning infrastructure—such as servers, networks, and databases—using tools like Terraform for provisioning and Ansible for configuration management.
- Mastered how to work with major cloud providers like Amazon Web Services (AWS), Google Cloud Platform (GCP) to provision and manage cloud-native applications and services.
- Mastered how to monitor the health and performance of applications and infrastructure using observability tools like Prometheus and Grafana to gain insights into systems and set up effective alerting.
- Mastered foundational networking concepts, including IP addresses, DNS, load balancing, and firewalls, to effectively configure and troubleshoot cloud and container environments
- Build a strong foundation in Linux administration and learned how to automate repetitive tasks by writing scripts in Bash and Python.
- Mastered essential Git commands for managing source code, collaborating with teams, and controlling version changes.
- Gained hands-on experience on integrating security practices directly into the CI/CD pipeline and learned Site Reliability Engineering (SRE) principles to manage and measure the reliability of services.
